Observable universe - Wikipedia The observable universe is a spherical region of the Universe comprising all matter that can be observed from Earth at the present time, because electromagnetic radiation from these objects has had time to reach Earth since the beginning of the cosmological expansion. There are at least 2 trillion galaxies in the observable universe. Assuming the universe is isotropic, the distance to the edge. Universe - Wikipedia The Universe is all of space and time and their contents, including planets, stars, galaxies, and all other forms of matter and energy. While the spatial size of the entire Universe is still unknown, it is possible to measure the observable universe. The earliest scientific models of the Universe were developed by ancient Greek and Indian philosophers and were geocentric, placing Earth at the center. How are galaxies moving away faster than light? - Phys.org Official cosmology is based on the presuppositions that 1) the universe has a beginning and a Big Bang started it, 2) velocity of light (though constant locally) is an absolute universal constant and everything else is relative, 3) redshift is a measure of distance, 4) Supernova Type 1a is the only kind of Supernova, 5) the cosmic monsters like black hole, dark matter/ energy exists etc.

Galaxy - Types of galaxies | Britannica.com Galaxy - Types of galaxies: Almost all current systems of galaxy classification are outgrowths of the initial scheme proposed by the American astronomer Edwin Hubble in 1926. In Hubble's scheme, which is based on the optical appearance of galaxy images on photographic plates, galaxies are divided into three general classes: ellipticals, spirals, and irregulars.

Researchers capture first 'image' of a dark matter web ... The composite image, which combines a number of individual images, confirms predictions that galaxies across the universe are tied together through a cosmic web connected by dark matter that has until now remained unobservable. Dark matter, a mysterious substance that comprises around 25 per cent of the universe, doesn't shine, absorb or reflect light, which has traditionally made it largely invisible.
